

Comparing health facility location data available for Saint Louis, Senegal

Andy South @afrimapr, Mark Herringer @sharehealthdata, Lamine Ndiaye @lamineyasey

DRAFT 2022-03-24

This is a data-driven document [open-source code here](#)

Funded by COVIDaction Vaccine Data Co-Lab - [Healthsites.io](#) Emergency health data validation.

Initial comparison of data provided by COUS [Centre des Opérations d'Urgence Sanitaire](#) & DPRS [Direction de la Planification, de la Recherche et des Statistiques](#) for Saint Louis with OSM Senegal survey conducted in February 2022.

Summary The aim is to see if we can develop re-useable code to help with the process of improving health facility location data by comparing and combining data from different sources.

Prior to an in person workshop COUS and DPRS provided data.

COUS provided data for 9 facilities in Saint Louis in a table with **9 rows** and **130 columns** including coordinates and attributes such as the numbers of beds and staff.

DPRS provided the names of facilities and regions for Saint Louis in a file with **374 rows and 1 column**. Due to the format of the data, it is not straightforward automatically to compare these with the COUS data.

OSM Senegal surveyed facilities in person in Saint Louis, providing a file with **394 rows** and recording attribute data in **289 columns**.

source	num facilities	columns of info	coords?
1. COUS	9	130	coords
3. DPRS	<374	1	no
2. OSM-Senegal survey	394	289	coords

Agreement on a strict naming convention for facilities would make it much easier to compare and combine these data.

COUS data

COUS provided an Excel file with two sheets.

COUS Sheet2 for Saint Louis has nine facilities **9 rows** and **130 columns** including coordinates and attributes such as the numbers of beds and staff.

Names of facilities.

cous_names
EPS1 de Richard Toll
Centre de Sante de Dagana
Centre de Sante de Saint Louis
Centre de Sante Amadou Malick Gaye
Centre de Sante de Pete
Centre de santé de Richard Toll
HOPITAL REGIONAL DE SAINT LOUIS
CHR NDioum
Centre de santé de Ross Bethio

DPRS data

DPRS provided the names of facilities and regions for the whole country in a file with **374 rows and 1 column**.

Looking at the first 9 rows of the DPRS data.

dprs_names
[-] RM Saint-Louis
[-] Dagana
CS Dagana
DPC de Dagana
PM MAC Dagana
PS 4e Et 5e Secteur
[-] PS Bokhol
Case de Geum Yalla
PS Bouteyni

We can see that sometimes rows indicate regions, e.g. [-] **RM Saint-Louis** and [-] **Dagana**. Also sometimes a row with a [-] indicates a facility that has control over others e.g. [-] **PS Bokhol**. Seems that if a row has a [-] and does not have PS, CS or Case then it is a region instead of a facility - this could be extracted automatically.

We can compare the COUS & DPRS tables above to check whether the facility names in the COUS data appear exactly the same as in the DPRS data. We would need to be able to write code to find matching names to be able to write a reproducible pipeline for comparing data.

An initial search by eye shows the mismatches between naming in the two datasets. There is at least one facility in the COUS data that seems not present in the DPRS list (Centre de Sante Amadou Malick Gaye).

See section below for Comparison of facility naming between DPRS and the new OSM-Senegal survey.

Categories of COUS health facilities Saint Louis

The coordinates provided in the COUS data allow these to be plotted on maps. (Note that one coordinate was missing a negative sign that incorrectly placed it in Chad, it was corrected for the maps here).

OSM-Senegal survey

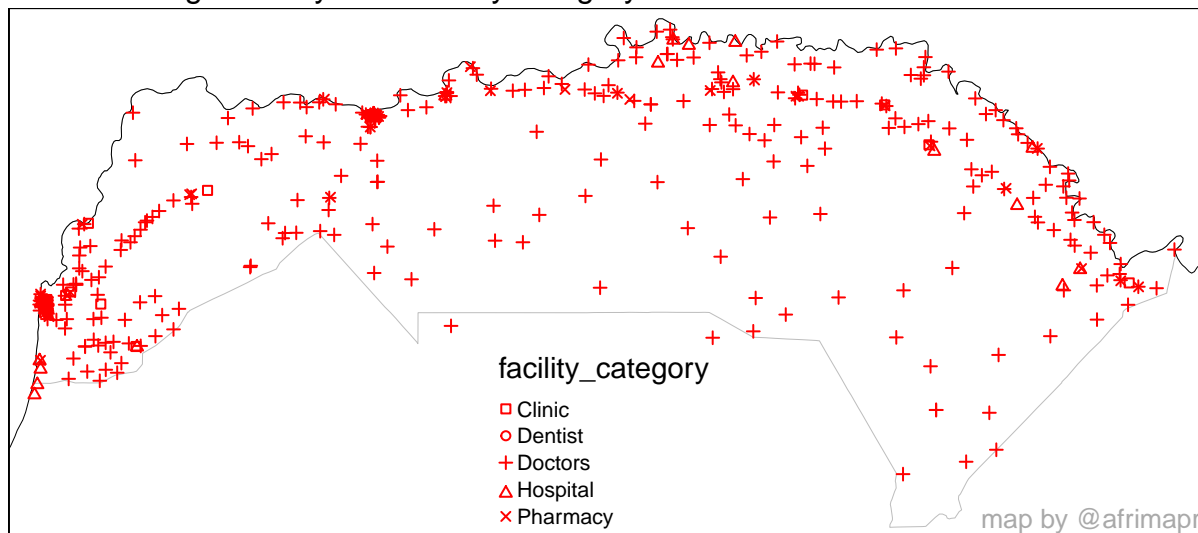

OSM-Senegal surveyed facilities in person in Saint Louis in February 2022, providing a file with 394 rows and recording attribute data in 289 columns. Here are some maps summarising the facilities surveyed.

Categories of facilities in OSM-Senegal survey

Senegal health facility levels are converted into OSM categories of Hospital, Clinic, Doctor as follows :

Senegal level	Senegal type	Senegal abbreviation	OSM category
1	Hopital	HP	Hospital
1	Etablissement public de Santé 1 (départementale)	EPS 1	Hospital
1	Etablissement public de Santé 2 (régionale)	EPS 2	Hospital
1	Etablissement public de Santé 3 (nationale)	EPS 3	Hospital
2	Centre de Santé	CS	Clinic
2	District de Sanitaire	DS	Clinic
3	Poste de Santé	PS	Doctors
3	Case de Santé	Case de	Doctors

OSM–Senegal survey 2022 facility category

Numbers of beds, doctors and nurses from OSM-Senegal survey

OSM number_of_beds

OSM number_of_doctors

OSM number_of_nurses

Using the new OSM-survey data to inform a specific user story

User story: As a Pregnant women I want to know the availability of a specialist in the event of a complication so that I can plan for my pregnancy.

To identify such specialist facilities we can start to build a data query like this.

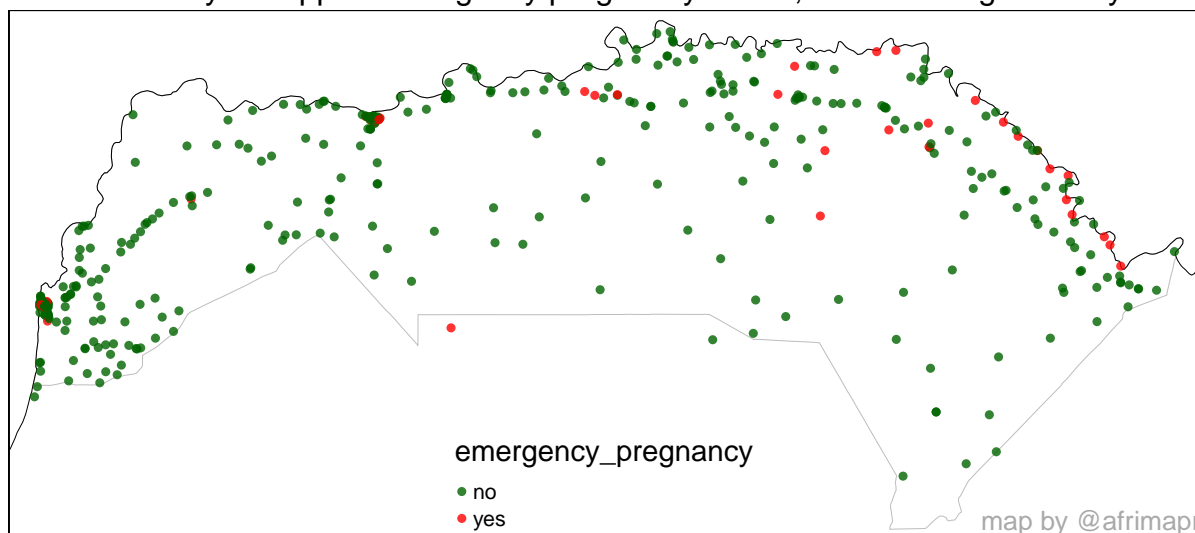

```
amenity = clinic or doctors or hospital
or
healthcare = doctor or hospital or clinic
and
beds >= 1
emergency = yes
contact:phone = phone number
```

With the collected survey data we can express this as :

```
facility_category = Clinic or Doctors or Hospital
operational_status = operational
emergency_services = Yes
number_of_beds > 0
phone_number = present
```

Facility.likely.to.support.emergency.pregnancy	Freq
no	359
yes	35

Facilities likely to support emergency pregnancy needs, OSM–Senegal survey 2022

Comparison of facility naming between DPRS and the new OSM-Senegal survey

Can we automatically match facility names in the OSM-Senegal survey data with their equivalent names used by DPRS ?

In short, not with the raw data. Trying to match the exact names results in zero matches between DPRS & OSM. This can be addressed.

The DPRS data mostly uses abbreviations for facility categories.

Senegal level	OSM naming	DPRS abbreviation
1	Hopital	HP
1	Établissement public de santé	EPS
2	Centre de Santé	CS
2	District de Sanitaire	DS
3	Poste de Santé	PS
3	Case de Santé	Case de

Other DPRS abbreviations DPC (3), PM (9 of them).

There are also differences in upper/lower case, accents, use of 'de' & spaces.

We can try the following to match the names

1. expanding the abbreviations from DPRS
2. remove accents
3. convert to lower case
4. ensure just single spaces

5. remove 'de'
6. remove '[-]' which indicates hierarchy in DPRS

We can apply these approaches to both datasets, then we get simplified names. **137** of these simplified names from the OSM-survey data match with the DPRS list. Here are the first few as an example.

x
case sante grand mpal
case sante mbaye mbaye sarr
case sante khelcom diop
case sante merina sall
case sante ndialakhar peulh
case sante mbathiass
case sante semel
case sante touba guene
case sante gantour

This leaves **301** facilities in the OSM survey data that do not match names in the DPRS data. This can be because :

1. facility is not present in DPRS (note the survey included 61 pharmacies and 2 dentists not present in DPRS)
2. the simplified name still differs from how the same facility is named within the OSM data.

Removing pharmacies & dentists leaves **238** un-matched names shown in the table below.

Var1	Freq
Clinic	14
Dentist	2
Doctors	206
Hospital	18
Pharmacy	61
